EXECUTIVE SUMMARY

Q8JAN is a fixed-supply digital asset developed on the TRON blockchain using the TRC-20 token standard.

The project was created around a straightforward philosophy: build a cryptocurrency that is transparent, secure, and easy to understand without relying on unnecessary complexity.

Unlike many digital assets that depend on transaction taxes, hidden token creation, or complicated reward mechanisms, Q8JAN adopts a minimalist architecture that prioritizes clarity and long-term sustainability.

The smart contract permanently creates the entire token supply during deployment. After deployment, no additional tokens can ever be minted.

Token holders retain the ability to permanently remove their own tokens from circulation through the standard burn mechanism, reducing the circulating supply over time without introducing inflation.

Every component of the project has been designed with transparency in mind.

The source code is publicly available, documentation is maintained openly, and every release is version-controlled through the official project repository.

Q8JAN does not attempt to compete through unrealistic promises or unnecessary technical complexity.

Instead, it focuses on delivering a reliable digital asset capable of serving as a long-term participant within the TRON ecosystem.

The project emphasizes responsible development, open-source principles, and sustainable community growth while maintaining compatibility with standard blockchain infrastructure.

Q8JAN represents the first official release of a digital asset designed to combine simplicity, transparency, and security into a single fixed-supply cryptocurrency.

PROJECT OVERVIEW

The cryptocurrency industry continues to evolve rapidly, introducing new technologies, decentralized financial services, and blockchain-based applications.

While innovation remains essential, many projects have gradually become increasingly difficult for users to understand due to complicated token economics and continuously changing supply mechanisms.

Q8JAN was created to provide an alternative approach.

Rather than introducing additional complexity, the project focuses on creating a digital asset whose behavior can be independently verified by anyone.

Every design decision follows one objective:

Keep the protocol transparent, secure, and predictable.

Our Vision

The vision of Q8JAN is to establish a trusted, transparent, and sustainable digital asset within the TRON blockchain ecosystem.

The project is built around the belief that long-term value is created through credibility, technical reliability, and responsible development rather than short-term speculation.

Q8JAN aims to become a recognizable digital asset that is respected for its simplicity, security, and transparency.

Rather than pursuing rapid expansion through unnecessary complexity, the project seeks steady and sustainable growth supported by a strong community and open development practices.

As blockchain technology continues to mature, Q8JAN intends to evolve alongside the ecosystem while preserving its original principles of transparency and fixed supply.

The long-term objective is not simply to launch another cryptocurrency, but to establish a reliable digital asset capable of supporting future blockchain applications and partnerships without compromising its core philosophy.

Long-Term Objectives

The long-term objectives of Q8JAN include:

- Building a transparent blockchain project. •
- Supporting sustainable ecosystem growth. •
- Maintaining a permanently fixed token supply. •
- Providing open-source documentation. •
- Encouraging responsible community participation. •
- Expanding practical blockchain adoption. •

Every future milestone will continue following these objectives while maintaining technical stability.

3. MISSION

Our Mission

The mission of Q8JAN is to deliver a secure digital asset built upon simplicity, transparency, and long-term sustainability.

The project intentionally avoids unnecessary complexity in order to maximize clarity for users, developers, exchanges, and independent auditors.

Every decision within the project follows four fundamental principles:

Transparency

All important project documentation, source code, and development history remain publicly accessible.

Security

The smart contract minimizes unnecessary logic and follows established development standards.

Simplicity

Users should understand how the token operates without requiring extensive technical knowledge.

Sustainability

The project focuses on long-term development rather than temporary market attention.

These principles guide every future release of the Q8JAN ecosystem.

Core Values

The Q8JAN project is based upon the following values:

Integrity

Transparency

Security

Accountability

Community

Innovation

These values represent the foundation upon which every future decision will be evaluated.

4. MARKET OVERVIEW

The Evolution of Digital Assets

Since the introduction of blockchain technology, digital assets have transformed the global financial landscape.

Thousands of cryptocurrencies have been introduced with different objectives, ranging from payment systems to decentralized finance, gaming ecosystems, and infrastructure platforms.

While innovation has accelerated rapidly, increasing technical complexity has often made projects difficult for ordinary users to understand.

Many modern cryptocurrencies include multiple token mechanisms such as:

- Reflection rewards
- Dynamic transaction taxes
- Inflationary minting
- Automatic liquidity generation
- Multi-layer governance systems

Although these mechanisms may provide additional functionality, they frequently reduce transparency.

Q8JAN intentionally adopts a different approach.

Instead of maximizing complexity, the project minimizes it.

The objective is to create a digital asset whose behavior remains predictable, verifiable, and understandable throughout its lifecycle.

The Need for Transparency

Trust remains one of the most valuable assets within blockchain ecosystems.

Users increasingly demand projects that clearly explain:

- How tokens are created.

- How supply changes.

- Whether additional minting is possible.

- Whether hidden transaction taxes exist.

- How governance decisions are made.

Q8JAN addresses these concerns through complete transparency.

Every important technical component is publicly documented.

Every future update will be version-controlled and released through the official repository.

5. WHY TRON

The TRON blockchain provides a mature environment for launching scalable digital assets.

Several characteristics influenced the decision to adopt TRON as the project's primary blockchain.

Fast Transactions

TRON processes transactions quickly, providing an efficient user experience for token transfers.

Low Transaction Costs

The network allows digital assets to operate with significantly lower costs compared with many alternative blockchain networks.

This makes Q8JAN practical for everyday transfers.

Mature Infrastructure

TRON offers:

- Wallet compatibility

- Explorer support

- Smart contract capabilities

Decentralized exchange integration •

Established developer ecosystem •

These characteristics simplify future ecosystem expansion.

Global Accessibility

The TRON blockchain supports millions of users worldwide and continues expanding through decentralized applications and digital asset adoption.

Q8JAN benefits from participating within this established infrastructure.

Why Q8JAN Selected TRON

The decision to launch on TRON reflects the project's commitment to practical usability.

Rather than prioritizing experimental technologies, Q8JAN focuses on reliability.

TRON provides the balance of performance, scalability, and ecosystem maturity required to support long-term project growth.

6. PROJECT PHILOSOPHY

The philosophy behind Q8JAN can be summarized in one sentence:

Keep blockchain simple, transparent, and secure.

The project deliberately avoids unnecessary token mechanics that may complicate user understanding or introduce avoidable risks.

Every feature included within the protocol must satisfy three requirements:

Improve transparency. •

Preserve security. •

Maintain simplicity. •

If a proposed feature does not satisfy these requirements, it should not become part of the protocol.

This philosophy will continue guiding future project development regardless of ecosystem expansion.

The Principle of Simplicity

Simple software is generally:

- Easier to audit. •
- Easier to verify. •
- Easier to maintain. •
- Easier to trust. •

Q8JAN embraces these engineering principles from the very beginning of the project.

The objective is not to become the most complicated blockchain project.

The objective is to become one of the most transparent.

7. TOKEN INFORMATION

Overview

Q8JAN is a decentralized digital asset deployed on the TRON blockchain using the TRC-20 token standard.

The project was designed to provide a transparent and permanently fixed digital currency that operates without hidden inflation, transaction taxes, or unnecessary administrative complexity.

The token is intended to function as the primary digital asset of the Q8JAN ecosystem while maintaining compatibility with standard TRON wallets, decentralized exchanges, and blockchain infrastructure.

The complete token supply is generated once during deployment and cannot be increased thereafter.

Token Specifications

Property	Value
Project Name	Q8JAN
Token Name	Q8JAN
Symbol	Q8JAN
Blockchain	TRON
Token Standard	TRC-20
Smart Contract Language	Solidity
Decimals	18
Maximum Supply	100,000,000,000 Q8JAN
Initial Supply	100,000,000,000 Q8JAN
Mint Function	Disabled
Burn Function	Enabled
Transaction Tax	0%
Ownership Model	Fixed Supply

Fixed Supply

The Q8JAN token follows a permanently fixed supply model.

The total supply is created once during deployment through the constructor of the smart contract.

After deployment:

- No additional tokens can be created.
- No inflation mechanism exists.
- The maximum supply can never increase.
- Holders always know the absolute supply limit.

This approach promotes predictability and long-term confidence.

Decimals

Q8JAN uses eighteen (18) decimal places.

This follows the common standard used across many blockchain ecosystems and allows precise token transfers and future compatibility with decentralized applications.

Transaction Policy

The token transfer mechanism follows the standard TRC-20 implementation.

There are:

- No transfer fees.
 - No reflection rewards.
 - No automatic liquidity generation.
 - No redistribution mechanism.
 - No hidden deductions.
- Users always transfer the exact amount specified.

8. TOKENOMICS

Philosophy

The tokenomics model was intentionally designed to remain simple, transparent, and easy to understand.

Unlike many blockchain projects that rely on dynamic token issuance or complicated incentive mechanisms, Q8JAN maintains a permanently fixed supply.

The objective is to preserve scarcity while avoiding future inflation.

Initial Allocation

The initial allocation has been structured to support project development while ensuring sufficient liquidity for public trading.

Allocation Percentage

Founder & Treasury	50%
Liquidity	30%
Marketing	10%
Strategic Reserve	10%

Founder & Treasury

This allocation supports:

- Long-term development •
- Infrastructure maintenance •
- Operational expenses •
- Future ecosystem improvements •

The treasury exists to ensure sustainable project growth.

Liquidity Allocation

Liquidity is reserved for decentralized exchange trading pairs.

Adequate liquidity improves:

- Trading stability •
- Market accessibility •
- Price discovery •
- User experience •

Marketing Allocation

The marketing allocation supports:

- Community growth •
- Educational campaigns •
- Strategic promotion •
- Brand awareness •

Marketing activities will prioritize transparency over speculative advertising.

Strategic Reserve

The reserve allocation is intended for future opportunities, including:

- Partnerships •
- Ecosystem development •
- Exchange-related initiatives •
- Unexpected operational requirements •

The reserve contributes to long-term flexibility without affecting the total supply.

Tokenomics Principles

The tokenomics model follows five guiding principles:

- Fixed Supply • 1

Transparency .٢

Sustainability .٣

Simplicity .٤

Predictability .٥

These principles remain unchanged throughout the project's lifecycle.

9. SMART CONTRACT ARCHITECTURE

Design Philosophy

The smart contract was intentionally developed using a minimalist architecture.

Rather than maximizing functionality, the design minimizes unnecessary complexity.

The objective is to reduce potential attack surfaces while improving maintainability and transparency.

Development Standards

The smart contract follows industry-recognized development practices.

The implementation is based upon OpenZeppelin smart contract libraries, which have undergone extensive community review.

This approach improves:

- Reliability •
- Compatibility •
- Maintainability •
- Security •

Core Functions

The contract performs only the essential functions required for a standard digital asset.

Primary functionality includes:

- Token transfers •
- Balance management •
- Allowance management •
- Burn functionality •

No hidden administrative token creation exists.

Burn Mechanism

Any token holder may permanently destroy tokens through the standard burn function.

Characteristics include:

- Voluntary •
- Irreversible •
- Publicly verifiable •
- Supply reducing •

Burning affects only the holder performing the operation.

Minting Policy

The contract contains no publicly accessible mint function.

No future release can increase the maximum supply of Q8JAN without deploying an entirely different smart contract.

This permanently protects holders from unexpected inflation.

10. TECHNICAL SPECIFICATIONS

Component	Specification
Blockchain	TRON
Standard	TRC-20
Compiler	Solidity 0.8.20+
Libraries	OpenZeppelin
Supply Model	Fixed
Mint	Disabled
Burn	Enabled
Tax	None
Repository	GitHub
Deployment	TRON Mainnet

Smart Contract Goals

The contract was developed to achieve the following engineering objectives:

- Maximum transparency. •
- Minimal complexity. •
- Standard compatibility. •
- Secure implementation. •
- Predictable behavior. •
- Long-term maintainability. •

Every future version of the smart contract will continue following these objectives.

11. REPOSITORY STRUCTURE

The project repository has been organized according to modern software engineering practices.

The repository includes:

- Smart Contracts •
- Deployment Scripts •
- Verification Scripts •
- Build Artifacts •
- Documentation •
- Whitepaper •
- Audit Report •
- Security Policy •
- Launch Checklist •
- Website •

This organization improves maintainability while ensuring that every important project component remains publicly accessible.

Repository Philosophy

The repository is designed to provide complete transparency.

Every future release will continue documenting:

- Source code. •
- Build process. •
- Documentation updates. •
- Release history. •
- Security improvements. •

The objective is to ensure that every version of Q8JAN remains independently verifiable.

12. SECURITY FEATURES

Security First Philosophy

Security has been a fundamental consideration throughout every stage of the Q8JAN development process.

Rather than relying on complicated token mechanics or privileged administrative controls, the project follows a minimalist architecture that reduces unnecessary risk while maintaining compatibility with established blockchain standards.

Every design decision has been evaluated according to one simple question:

Does this improve security without sacrificing transparency?

Only features that satisfy this principle are included within the protocol.

Fixed Supply Protection

The total supply of Q8JAN is permanently fixed during deployment.

Once the smart contract has been deployed to the TRON blockchain:

- No additional tokens can be created.
- No hidden inflation mechanisms exist.
- The maximum supply can never increase.

This protects every holder from unexpected token inflation.

No Hidden Mint Function

The Q8JAN smart contract intentionally excludes any public or administrative mint function.

As a result:

- Future token creation is impossible.
- Supply manipulation cannot occur.
- Token economics remain permanently predictable.

This represents one of the project's most important security commitments.

Burn Function

The burn mechanism follows the standard implementation provided by OpenZeppelin.

Characteristics include:

- Holder initiated. •
- Permanent. •
- Transparent. •
- Publicly verifiable. •

Burning tokens reduces the circulating supply without affecting the maximum historical issuance.

Standard Transfer Logic

Transfers follow the standard TRC-20 implementation.

The contract intentionally avoids:

- Reflection rewards. •
- Dynamic transfer taxes. •
- Automatic liquidity generation. •
- Blacklisting systems. •
- Hidden wallet restrictions. •
- Administrative transfer controls. •

This ensures predictable behavior across all compatible wallets and exchanges.

Open Source Security

Transparency improves security.

The complete source code is publicly available, allowing independent developers to:

- Review the implementation. •
- Verify compilation. •

Compare deployed bytecode. •

Confirm the absence of hidden functionality. •

Public review remains an essential component of blockchain security.

Security Summary

Feature	Status
Fixed Supply	Enabled
Burn Support	Enabled
Mint Function	Disabled
Transfer Tax	None
Open Source	Yes
Hidden Ownership Controls	None

13. INTERNAL AUDIT

Internal Review Process

Before the official release, the project underwent an internal technical review covering every major component.

The objective of this review was to ensure consistency between:

- Smart Contract •
- Deployment Scripts •
- Build Process •
- Documentation •
- Repository Structure •

The review also confirmed that every public document accurately reflects the behavior of the deployed contract.

Smart Contract Review

The contract was evaluated for:

- Supply integrity. •
- Transfer logic. •
- Burn functionality. •
- Mint prevention. •
- Compiler compatibility. •
- Deployment readiness. •

No critical inconsistencies were identified.

Documentation Review

Documentation was reviewed to ensure consistency across:

- Whitepaper •
- README •
- Tokenomics •
- Security Policy •
- Audit Report •
- Changelog •
- Launch Checklist •

Every document describes the same token model and development philosophy.

Repository Review

Repository organization was reviewed according to software engineering best practices.

The repository includes:

- Source code. •
- Documentation. •

- Build artifacts.
- Deployment scripts.
- Security documentation.
- Release history.

This structure supports long-term maintenance and transparency.

Audit Checklist

The following items were reviewed before release:

- ✓ Smart Contract Compilation
 - ✓ Fixed Supply Verification
 - ✓ Burn Function Verification
 - ✓ Mint Function Absence
- ✓ Deployment Script Validation
 - ✓ Repository Organization
- ✓ Documentation Consistency
 - ✓ Security Policy
 - ✓ Release Notes
 - ✓ License Verification

Audit Result

No critical issues were identified during the internal review.

The project is considered technically prepared for deployment pending completion of operational launch activities.

14. DEVELOPMENT STANDARDS

Engineering Principles

Q8JAN follows established engineering practices intended to maximize maintainability and transparency.

Development follows these principles:

- Simplicity
- Readability
- Security
- Consistency
- Documentation

Every future update should continue respecting these standards.

Code Quality

Source code should remain:

- Well documented.
- Easy to understand.
- Easy to maintain.
- Consistent with project documentation.

Reducing unnecessary complexity improves long-term project sustainability.

Documentation Standards

Every important project component should be documented.

Documentation includes:

- Technical specifications.
- Deployment instructions.
- Security documentation.
- Whitepaper.
- Repository guidelines.
- Release history.

Maintaining complete documentation supports independent verification.

Version Control

Every significant project change should be tracked through version control.

Benefits include:

- Transparent development history. •
- Easier auditing. •
- Reliable release management. •
- Better collaboration. •

Release Management

Every official release should include:

- Updated documentation. •
- Build artifacts. •
- Release notes. •
- Audit summary. •
- Whitepaper revision. •
- Repository update. •

This process ensures consistency across every public release.

Development Lifecycle

The Q8JAN development lifecycle follows five stages:

Stage One

Planning

Project objectives are defined.

Stage Two

Implementation

Smart contracts and supporting infrastructure are developed.

Stage Three

Review

Documentation and code undergo internal verification.

Stage Four

Deployment

The smart contract is deployed to the blockchain and publicly verified.

Stage Five

Maintenance

Future improvements continue while preserving transparency and security.

Quality Assurance

Quality assurance remains an ongoing responsibility.

Future releases will continue emphasizing:

- Stable software. •
 - Secure implementation. •
 - Transparent documentation. •
 - Community communication. •
 - Continuous improvement. •
-

15. COMMUNITY

Building a Sustainable Community

The long-term success of every blockchain project depends upon the strength of its community.

Technology creates the foundation of a project, but the community determines its long-term sustainability.

Q8JAN has been designed as a community-oriented digital asset where transparency, education, and responsible participation remain the primary drivers of growth.

Rather than pursuing temporary popularity through speculation, the project seeks to establish an informed community that understands both the technology and the long-term objectives of the ecosystem.

Every member of the community contributes to the project's credibility by promoting responsible discussion, constructive feedback, and accurate information.

Community Principles

The Q8JAN community follows several core principles:

Transparency

Communication should remain factual and supported by publicly available information.

Respect

Constructive discussion should always be encouraged regardless of differing opinions.

Responsibility

Community members should avoid spreading misinformation or unrealistic expectations.

Collaboration

Ideas, improvements, and constructive criticism are welcomed whenever they contribute to strengthening the project.

Long-Term Thinking

The project encourages sustainable participation rather than short-term speculation.

Community Participation

Community members may contribute by:

- Reporting issues. •
- Suggesting improvements. •
- Reviewing documentation. •
- Participating in educational discussions. •
- Promoting responsible blockchain adoption. •

The project values meaningful contributions more than short-term promotional activity.

Community Communication

Official communication channels will remain the primary source of verified information.

Community members should verify announcements before relying on unofficial sources.

Every significant update will be published through official project documentation and repository releases.

16. GOVERNANCE PHILOSOPHY

Governance Approach

Q8JAN intentionally adopts a simple governance philosophy during its initial development.

Rather than introducing complex voting systems or administrative structures before the project reaches maturity, governance focuses on technical stability and transparent decision-making.

Future governance mechanisms may evolve as the ecosystem expands.

Governance Principles

Every governance decision should prioritize:

- Security •
- Transparency •
- Technical Stability •
- Community Benefit •
- Long-Term Sustainability •

No governance mechanism should compromise the project's fixed-supply model or transparency commitments.

Future Governance

As adoption increases, future governance improvements may include structured community participation while maintaining project integrity.

Any governance evolution will be publicly documented before implementation.

Decision Making

Development decisions should be based upon:

- Technical evaluation. •
- Security review. •
- Community feedback. •
- Documentation consistency. •

This structured approach reduces unnecessary risk while encouraging responsible innovation.

17. MARKETING STRATEGY

Sustainable Marketing

Marketing should support education before promotion.

The objective is to increase awareness while maintaining technical accuracy.

Q8JAN does not rely upon exaggerated claims or unrealistic promises to attract attention.

Instead, the project focuses on credibility and measurable progress.

Phase One

The initial marketing stage focuses on project visibility.

Objectives include:

- Publishing official documentation. •
- Maintaining repository transparency. •
- Introducing the project to blockchain communities. •
- Building initial awareness. •

Phase Two

Following deployment:

- Increase community engagement. •
- Publish educational content. •
- Expand blockchain visibility. •
- Encourage ecosystem participation. •

Phase Three

Long-term objectives include:

- Strategic collaborations. •
- Educational partnerships. •
- Community growth. •
- Ecosystem expansion. •

Marketing activities will always prioritize transparency over speculation.

Brand Identity

The Q8JAN brand represents:

- Trust •
- Transparency •
- Simplicity •
- Security •
- Long-Term Vision •

Every public communication should reinforce these values.

18. EXCHANGE LISTINGS

Listing Philosophy

Exchange listings represent an important milestone but should occur only after the project reaches appropriate operational readiness.

The objective is sustainable accessibility rather than rapid expansion.

Initial Trading

The initial trading pair is expected to be:

Q8JAN / TRX

Liquidity will be established before public trading begins.

Listing Objectives

Potential future listing targets include:

- Decentralized Exchanges on TRON. •
- CoinGecko. •
- CoinMarketCap. •
- Additional cryptocurrency information platforms. •
- Centralized exchanges where appropriate. •

Every listing application will follow the specific requirements established by each platform.

Liquidity Strategy

Liquidity supports:

- Efficient trading. •
- Market accessibility. •
- Price discovery. •
- Reduced trading friction. •

The project recognizes liquidity as an essential component of a healthy market.

19. ECOSYSTEM GROWTH

Long-Term Development

Q8JAN has been designed as a foundation rather than a short-term product.

Future ecosystem growth may include:

- Community tools. •
- Educational initiatives. •
- Strategic partnerships. •
- Developer resources. •
- Blockchain integrations. •

Future expansion will remain consistent with the project's core philosophy.

Partnership Strategy

Potential partnerships will be evaluated according to:

- Technical compatibility. •
- Community benefit. •
- Long-term sustainability. •
- Shared commitment to transparency. •

Partnerships should strengthen the ecosystem without compromising project independence.

Developer Ecosystem

Developers are encouraged to review:

- Smart Contract. •
- Documentation. •
- Repository. •
- Release Notes. •
- Security Policy. •

Open collaboration contributes to stronger software and more resilient infrastructure.

20. FUTURE UTILITIES

Future Expansion

The initial release intentionally focuses on delivering a secure and transparent digital asset.

Future utilities may be considered after evaluating community demand and technical feasibility.

Possible future directions include:

- Payment integrations. •
 - Merchant adoption. •
 - Educational platforms. •
 - Community services. •
 - Blockchain applications. •
 - Developer APIs. •
-

Innovation Philosophy

Innovation should never compromise:

- Security. •
- Transparency. •
- Simplicity. •

Every future feature must demonstrate practical value before implementation.

Sustainable Growth

Growth should occur gradually through:

- Responsible development. •
- Community participation. •
- Technical excellence. •
- Transparent communication. •

This philosophy provides a stable foundation for future ecosystem expansion.

21. RISK FACTORS

Understanding Risk

Participation in cryptocurrency markets involves significant financial and technological risks.

Before acquiring Q8JAN, every participant should carefully evaluate their own financial circumstances and conduct independent research.

No digital asset should ever be considered risk-free.

Market Volatility

Cryptocurrency markets are highly volatile.

Token prices may increase or decrease significantly over short periods.

Market performance depends on numerous external factors including global economic conditions, market sentiment, liquidity, and blockchain adoption.

Regulatory Risk

Blockchain regulations continue to evolve worldwide.

Future legal or regulatory developments may affect cryptocurrency markets, exchanges, wallet providers, or blockchain-based applications.

Participants are responsible for understanding the legal requirements applicable within their own jurisdictions.

Technology Risk

Although every reasonable effort has been made to develop secure software, no software system can guarantee absolute protection against unforeseen vulnerabilities.

Future improvements may become necessary as blockchain technology evolves.

Liquidity Risk

Trading liquidity depends upon market participation.

During early project stages, liquidity may fluctuate as adoption grows.

Users should consider liquidity conditions before trading.

User Responsibility

Every holder remains responsible for:

- Protecting private keys. •
 - Securing wallet access. •
 - Verifying official contract addresses. •
 - Confirming information through official project channels. •
 - Performing independent research before making financial decisions. •
-

24. FREQUENTLY ASKED QUESTIONS

Can new Q8JAN tokens ever be created?

No.

The total supply is permanently fixed during deployment.

Is token burning supported?

Yes.

Token holders may permanently burn their own tokens using the standard burn function.

Does Q8JAN charge transaction fees?

No.

The smart contract applies no transaction tax or hidden transfer fee.

Is the smart contract open source?

Yes.

The source code is publicly available for review and verification.

What blockchain does Q8JAN use?

TRON Mainnet.

What token standard is implemented?

TRC-20.

Can the maximum supply change?

No.

The maximum supply is permanently fixed.

Where can official project information be found?

Official information is published through the GitHub repository, Whitepaper, and official project documentation.

25. CONCLUSION

Q8JAN was created with a straightforward objective:

To develop a transparent, secure, and permanently fixed digital asset for the TRON blockchain.

Rather than introducing unnecessary complexity, the project emphasizes clarity, responsible engineering, and long-term sustainability.

Every important component—from the smart contract architecture to the documentation—has been designed to remain publicly verifiable.

The project enters its first official release with a commitment to transparency, security, and continuous improvement.

Future development will continue following the same engineering principles that guided the initial implementation.

26. FINAL STATEMENT

The Q8JAN project represents the beginning of a long-term journey.

Version 1.0 establishes the project's technical foundation while demonstrating its commitment to responsible blockchain development.

Future releases will continue improving the ecosystem without compromising the project's original philosophy.

The Q8JAN team welcomes developers, researchers, community members, and blockchain enthusiasts who share the same commitment to openness, transparency, and sustainable innovation.
